PROJECT TOPIC: PLACEPRO — AI-POWERED PLACEMENT INTELLIGENCE PLATFORM

Group No.: [Enter Group Number]

Project Group Members:

1. [Student 1 — Section/Roll No./University Roll No.]
2. [Student 2 — Section/Roll No./University Roll No.]
3. [Student 3 — Section/Roll No./University Roll No.]
4. [Student 4 — Section/Roll No./University Roll No.]
5. [Student 5 — Section/Roll No./University Roll No.]

Project Supervisor: [Supervisor Name, Designation]

About the Project:

PlacePro is a web-based placement intelligence platform designed to reduce the manual effort involved in managing college examination results, mock interviews and placement data. Institutions can upload Excel or CSV files exported from their existing portals. The system detects columns, suggests mappings, validates records and preserves original data for traceability. It organizes student performance into configurable skill domains, individual skills and assessment parameters. AI-assisted processing interprets unstructured interviewer feedback, proposes structured observations and generates concise summaries while keeping extracted suggestions distinguishable from approved scores. Role-based portals provide separate capabilities for administrators, trainers and students. Administrators and authorized trainers can review records, analyze performance, rank candidates and configure company-specific eligibility and skill criteria. PlacePro evaluates students against these criteria, explains eligibility outcomes and supports filtered shortlist generation with Excel/CSV export. Database constraints, import history, versioned rules and audit records support data integrity, duplicate prevention and accountable updates.

Motivation:

Colleges often maintain examination and interview results in separate systems and manually consolidate exported spreadsheets for placement activities. This creates repetitive work, inconsistent records, duplicate entries and difficulty comparing student skills with company requirements. PlacePro centralizes this workflow, improves traceability and helps students and placement teams understand performance through structured data and explainable analytics. It supports more efficient, evidence-based placement preparation and candidate shortlisting.

Innovation:

- Dynamic column mapping and reusable import profiles for varying Excel/CSV formats.
- AI-assisted extraction and summarization of mixed-type interview feedback, with source traceability and human review.
- Configurable skill domains, parameters, scoring rules and student-specific applicability instead of fixed assessment fields.
- Concurrency-safe, idempotent imports and explicit revision handling to reduce duplicate or conflicting records.
- Explainable company matching that separates mandatory eligibility from weighted ranking and identifies missing data.
- Custom filters and permission-controlled Excel/CSV exports for company-specific shortlists.

Project Planning:

The project work is organized into phases covering requirement analysis, technology learning, database design, implementation, integration and verification. The schedule below follows the September 2025–March 2026 period specified in the university synopsis template.

Activity	Sep	Oct	Nov	Dec	Jan	Feb	Mar
Requirements and problem analysis	■						
Learning React, Node.js, Express and PostgreSQL	■	■					
Database schema and architecture		■					
Authentication and role-based portals			■	■			
Import, mapping and validation workflow			■	■			
Feedback extraction and scoring				■	■		
Company matching and exports					■	■	
Integration, testing and documentation						■	■

Tools Required:

➢ **Hardware Requirements:** Computer/laptop with a modern multi-core processor, minimum 8 GB RAM (16 GB recommended), adequate storage and internet connectivity.

➢ **Software Requirements:** Windows/Linux/macOS, Node.js, npm, React, Vite, Express.js, PostgreSQL, a compatible SQL client, Git, VS Code, CSV/XLSX processing libraries, and an AI API/provider configured for feedback extraction.

Expected System Output:

A role-based web application that imports and organizes placement assessment data, presents student skill and interview histories, provides reviewable AI-assisted feedback summaries, supports explainable company-specific eligibility and ranking, and generates filtered candidate exports with traceable data changes.
