PROJECT TOPIC: HELP TO HIRE – A FIT-BASED JOB MATCHING PLATFORM

Group No.: G171
Project Group Members:

1. Advay Sharma 2315000160
2. Akanksha Sahu 2315000174
3. Jatin Kumar Tureha 2315001016
4. Rudra Gupta 2315001894
5. Vikram Singh 2315002453

Project Supervisor: Mr. Manwatkar Sumedkumar Janardanji, Technical Trainer

About the Project: Help to Hire is a digital platform that connects job seekers with employers looking for workers. Job seekers can create profiles with their skills, education, experience, and job preferences. Verified employers can post jobs with details such as salary, location, working hours, and required skills. The platform matches job seekers with suitable jobs based on their skills, availability, and other requirements. Job seekers can apply for jobs and track their applications. Employers can review applicants, shortlist candidates, and schedule interviews. An admin panel will help verify employers and remove fake job posts. The platform will be free for job seekers and will use NextJS, NodeJS, ExpressJS and PostgreSQL. Its main goal is to make job searching easier and help people find suitable work opportunities.

Motivation: Unemployment and underemployment are major challenges for graduates and workers. Many people struggle to find suitable jobs due to limited access to opportunities that match their skills, location, and availability. This project aims to connect job seekers with suitable employers through a single digital platform. It is suitable as a final-year major project because it involves security, job matching, database management, and cloud deployment. It can help students, homemakers, and other job seekers find suitable work while helping employers hire workers more easily.

Innovation: Features not available in typical existing or student-level solutions:

2. Explainable match score: every job shows a 0–100 fit score with a breakdown (skills, job type, location, pay, experience), not just keyword results.
3. Availability-aware par t-time matching: days and hours a person can work are matched with the job's shift timing.
4. Ranked applicants for employers: applicants are sorted by match score, which cuts screening time for small employers.
5. Trust and safety: free for job seekers, verified employers only, and a “report fake job” option handled by admins.
6. Skill-gap hints: for almost-matching jobs the system lists the missing skills so the seeker knows what to learn.
7. Application timeline with notifications, so seekers always know the status of each application.

Project Planning: Work is divided into phases following the milestone guide (Requirement, Design, Development, Testing, Deployment, Final Submission), with the first two months also used to learn NextJS, NodeJS, ExpressJS and PostgreSQL full-text search. Duration: October 2026 to March 2027.

Phase	Sep	Oct	Nov	Dec	Jan	Feb	Mar
Learning tech stack							
Requirements & SRS							
System design							
Auth, profiles & job posting							
Job search, apply & tracking							
Matching engine & dashboards							
Testing & bug fixing							
Cloud deployment							
Report, PPT & demo							

Tools required:

- **Hardware Requirements:** Laptop; smartphone for responsive-design testing; stable internet connection.
- **Software Requirements:** NextJS, NodeJS, ExpressJS, PostgreSQL (full-text search), Postman, Git/GitHub, IntelliJ IDEA / VS Code, Cloudinary (resume storage), Resend API; Render / Vercel.
